MILESTONE 2

ProSense

Modular platform for intelligent functional training monitoring based on computer vision

Group 1
António Videira · David Cálix · Diogo Ruivo · Gabriel Riquito · Tiago Oliveira

ProSense

“ is an open, modular platform that turns functional training videos into movement metrics, for coaches, athletes, physiotherapists and researchers.

Swappable pose algorithms

Exercises defined by the coach (MDL)

State of the Art

What sets us apart from the software gyms already use

	Regybox	SugarWOD	Wodify	Beyond the Whiteboard	Our project
Automatic repetition counting from video	✗	✗	✗	✗	✓
Class results without manual logging	✗	✗	✗	✗	✓
Coach defines the criteria for each exercise	✗	✗	✗	✗	✓
Swappable analysis algorithms	✗	✗	✗	✗	✓
Class booking and payments	✓	✗	✓	✓	✗

Source: official websites and help centers of each product (Sep 2026).

Actors

Athlete

Records and submits videos, checks their metrics and progress over time, and receives feedback.

PT / Coach

Creates exercises with the MDL, schedules sessions, reviews videos with the skeleton overlay, compares performances and leaves feedback.

Physiotherapist

Tracks recovery with biomechanical metrics and defines rehabilitation. For home exercises, gets the algorithm's output on the patient's execution.

Admin

Views and creates groups (gyms, classes), links athletes and coaches, and manages users.

Researcher

Uses the platform to refine algorithms, compare pose models on the same videos and explore new uses in the future.

Use cases

Athlete · PT / Coach · Physiotherapist · Researcher · Admin

[2] phase 2

Access and organisation

- UC01 Authenticate — Athlete, PT / Coach, Physiotherapist, Researcher, Admin
- UC02 Manage own profile — Athlete, PT / Coach, Physiotherapist, Researcher, Admin
- UC03 Manage accounts and roles — Admin
- UC04 Manage groups and associations — Admin

Training log

- UC05 Record and upload video — Athlete
- UC06 Connect heart-rate sensor [2] — Athlete
- UC07 Train alone (assigned exercise) — Athlete
- UC08 Group class — Athlete, PT / Coach

Exercises and sessions

- UC09 Create exercise (MDL) — PT / Coach, Physiotherapist
- UC10 Assign exercise to athlete — PT / Coach, Physiotherapist
- UC11 Schedule session or plan — PT / Coach

Analysis and results

- UC12 View video + metrics — Athlete, PT / Coach, Physiotherapist
- UC13 Track progress over time — Athlete, PT / Coach, Physiotherapist
- UC14 Compare performance — PT / Coach
- UC15 Heart rate with metrics [2] — PT / Coach, Physiotherapist
- UC16 View alerts — Physiotherapist
- UC17 Generate report — Athlete, PT / Coach, Physiotherapist

Research

- UC21 Import datasets — Researcher
- UC22 Run pose estimators — Researcher
- UC23 Compare estimators — Researcher
- UC24 Export raw data — Researcher
- UC25 Add and configure plugins — Researcher

Follow-up and feedback

- UC18 Review home training — PT / Coach, Physiotherapist
- UC19 Give feedback — PT / Coach, Physiotherapist
- UC20 Read feedback — Athlete

Administration

- UC26 Configure plugins and devices — Admin
- UC27 Monitor system status — Admin
- UC28 Configure organisation — Admin

Functional requirements

38

requirements, in 7 packages

19 Must · **16** Should · **3** Could

Out of scope in phase 1:
bookings and payments · leaderboards · multi-camera

5 **Access and organisation**
Accounts, roles and groups

6 **Training log**
Record, upload, group classes

4 **Exercises and sessions**
Create with MDL, assign, schedule

9 **Analysis and results**
Video with skeleton and metrics

4 **Follow-up and feedback**
Adherence and comments to athletes

6 **Research**
Datasets, estimators and plugins

4 **Administration**
Plugins, devices and status

Non-functional requirements

How the system should behave, with verifiable targets

Performance

≤ 2 s

for 95% of interface and API requests; analysis runs in the background

Availability

≥ 95 %

per month, excluding planned maintenance; uploads are still accepted if the worker is down

Maintainability

Plugins

new estimator without touching the core; validated by integrating 2 estimators

Security

By role

access by profile and by athlete association; GDPR policy to be defined

Data integrity

Traceable

every result links to video, plugin, version and parameters

Usability

WCAG AA

web accessibility, reviewed in MS3

Interoperability

CSV · JSON

open formats to import and export data

Recoverability

Retry

failed tasks can be reprocessed by the admin

Assumptions and dependencies

Assumptions

We assume that…

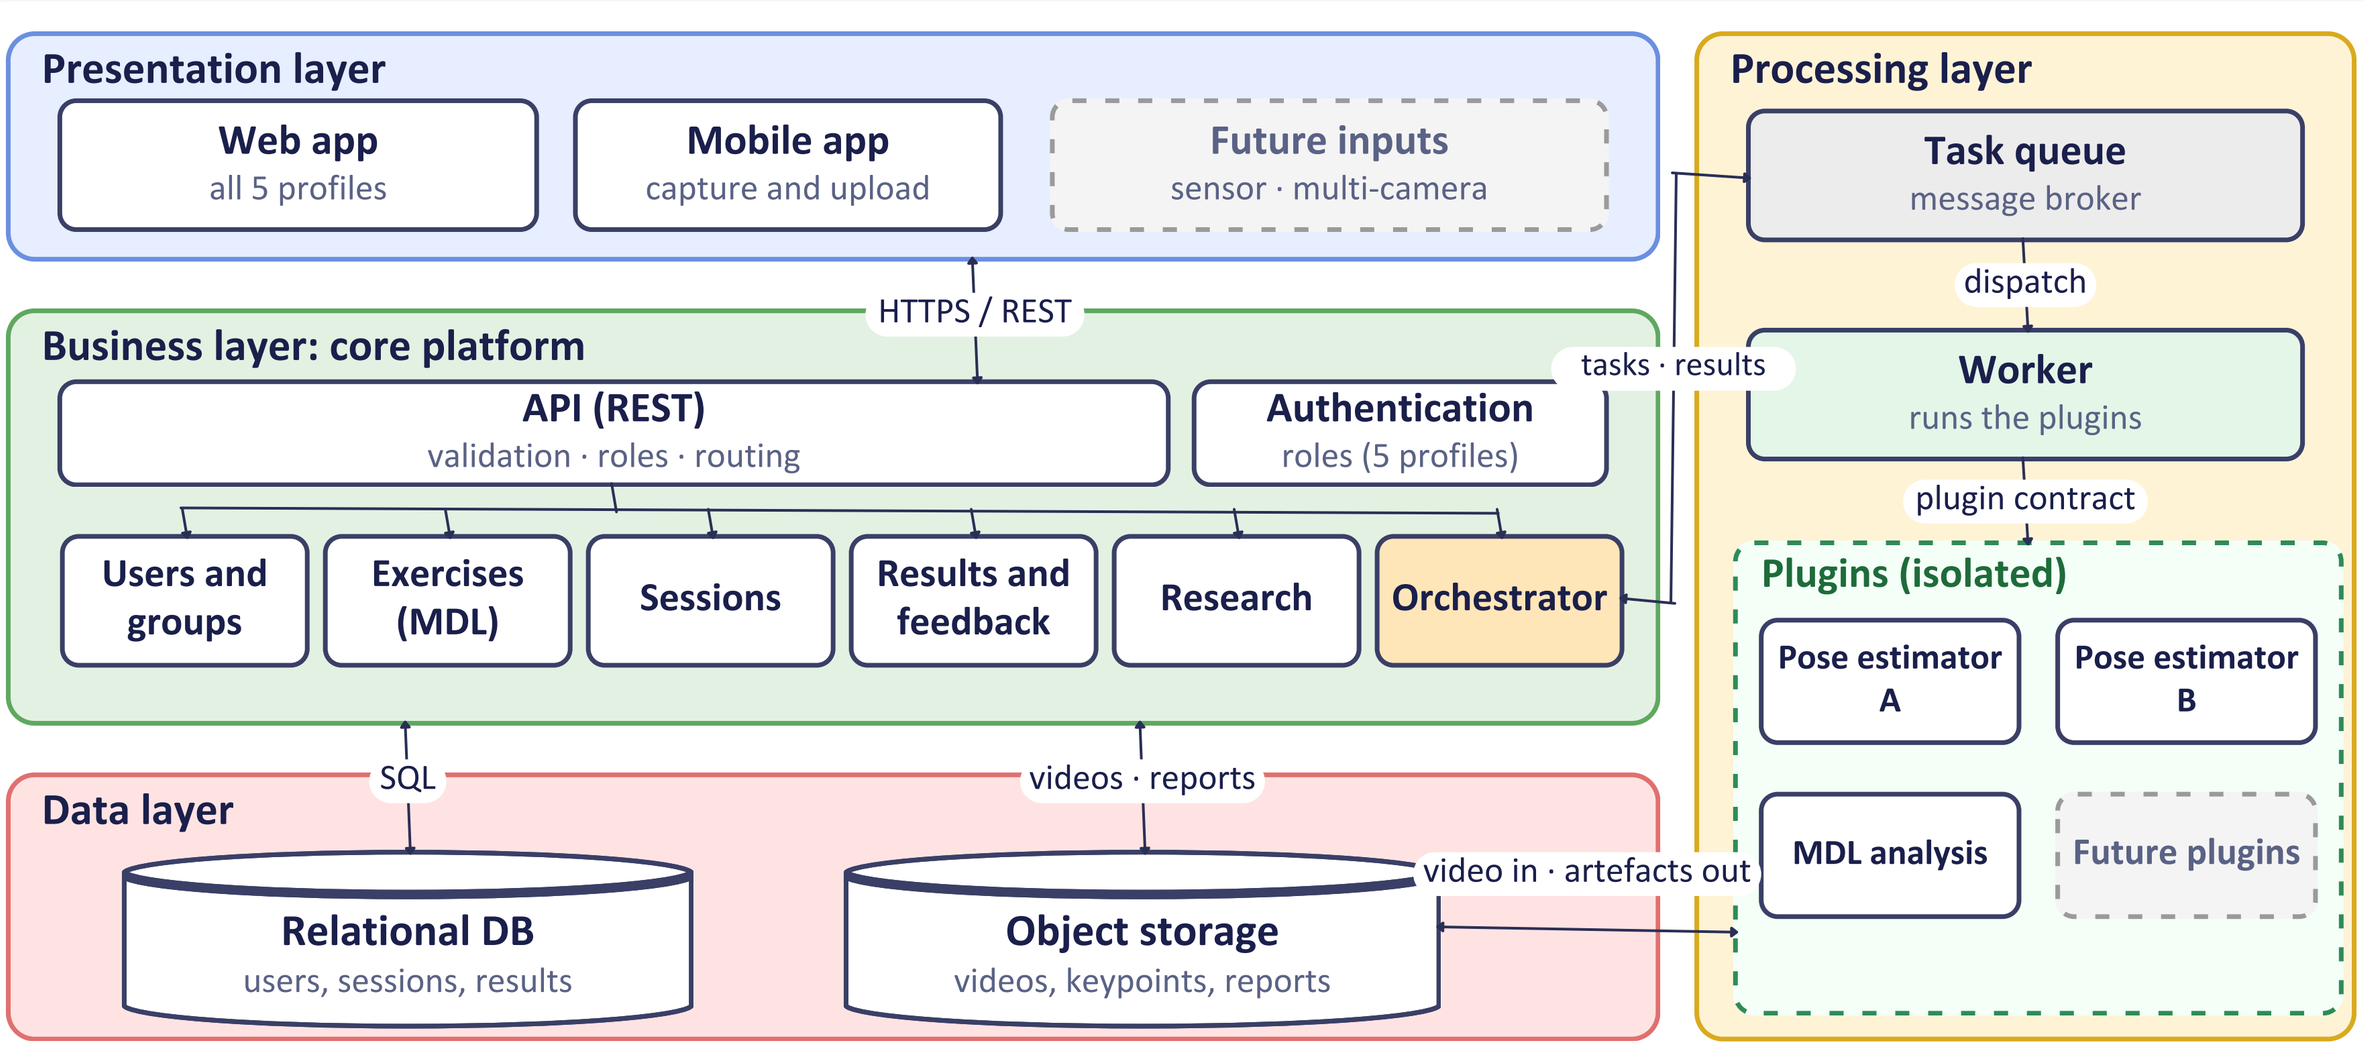

- Each athlete has a smartphone and internet access
- One video, one person, one camera
- Pose estimators are accurate on smartphone video (to be validated)
- Requirements may change with feedback from professionals

Dependencies

We need…

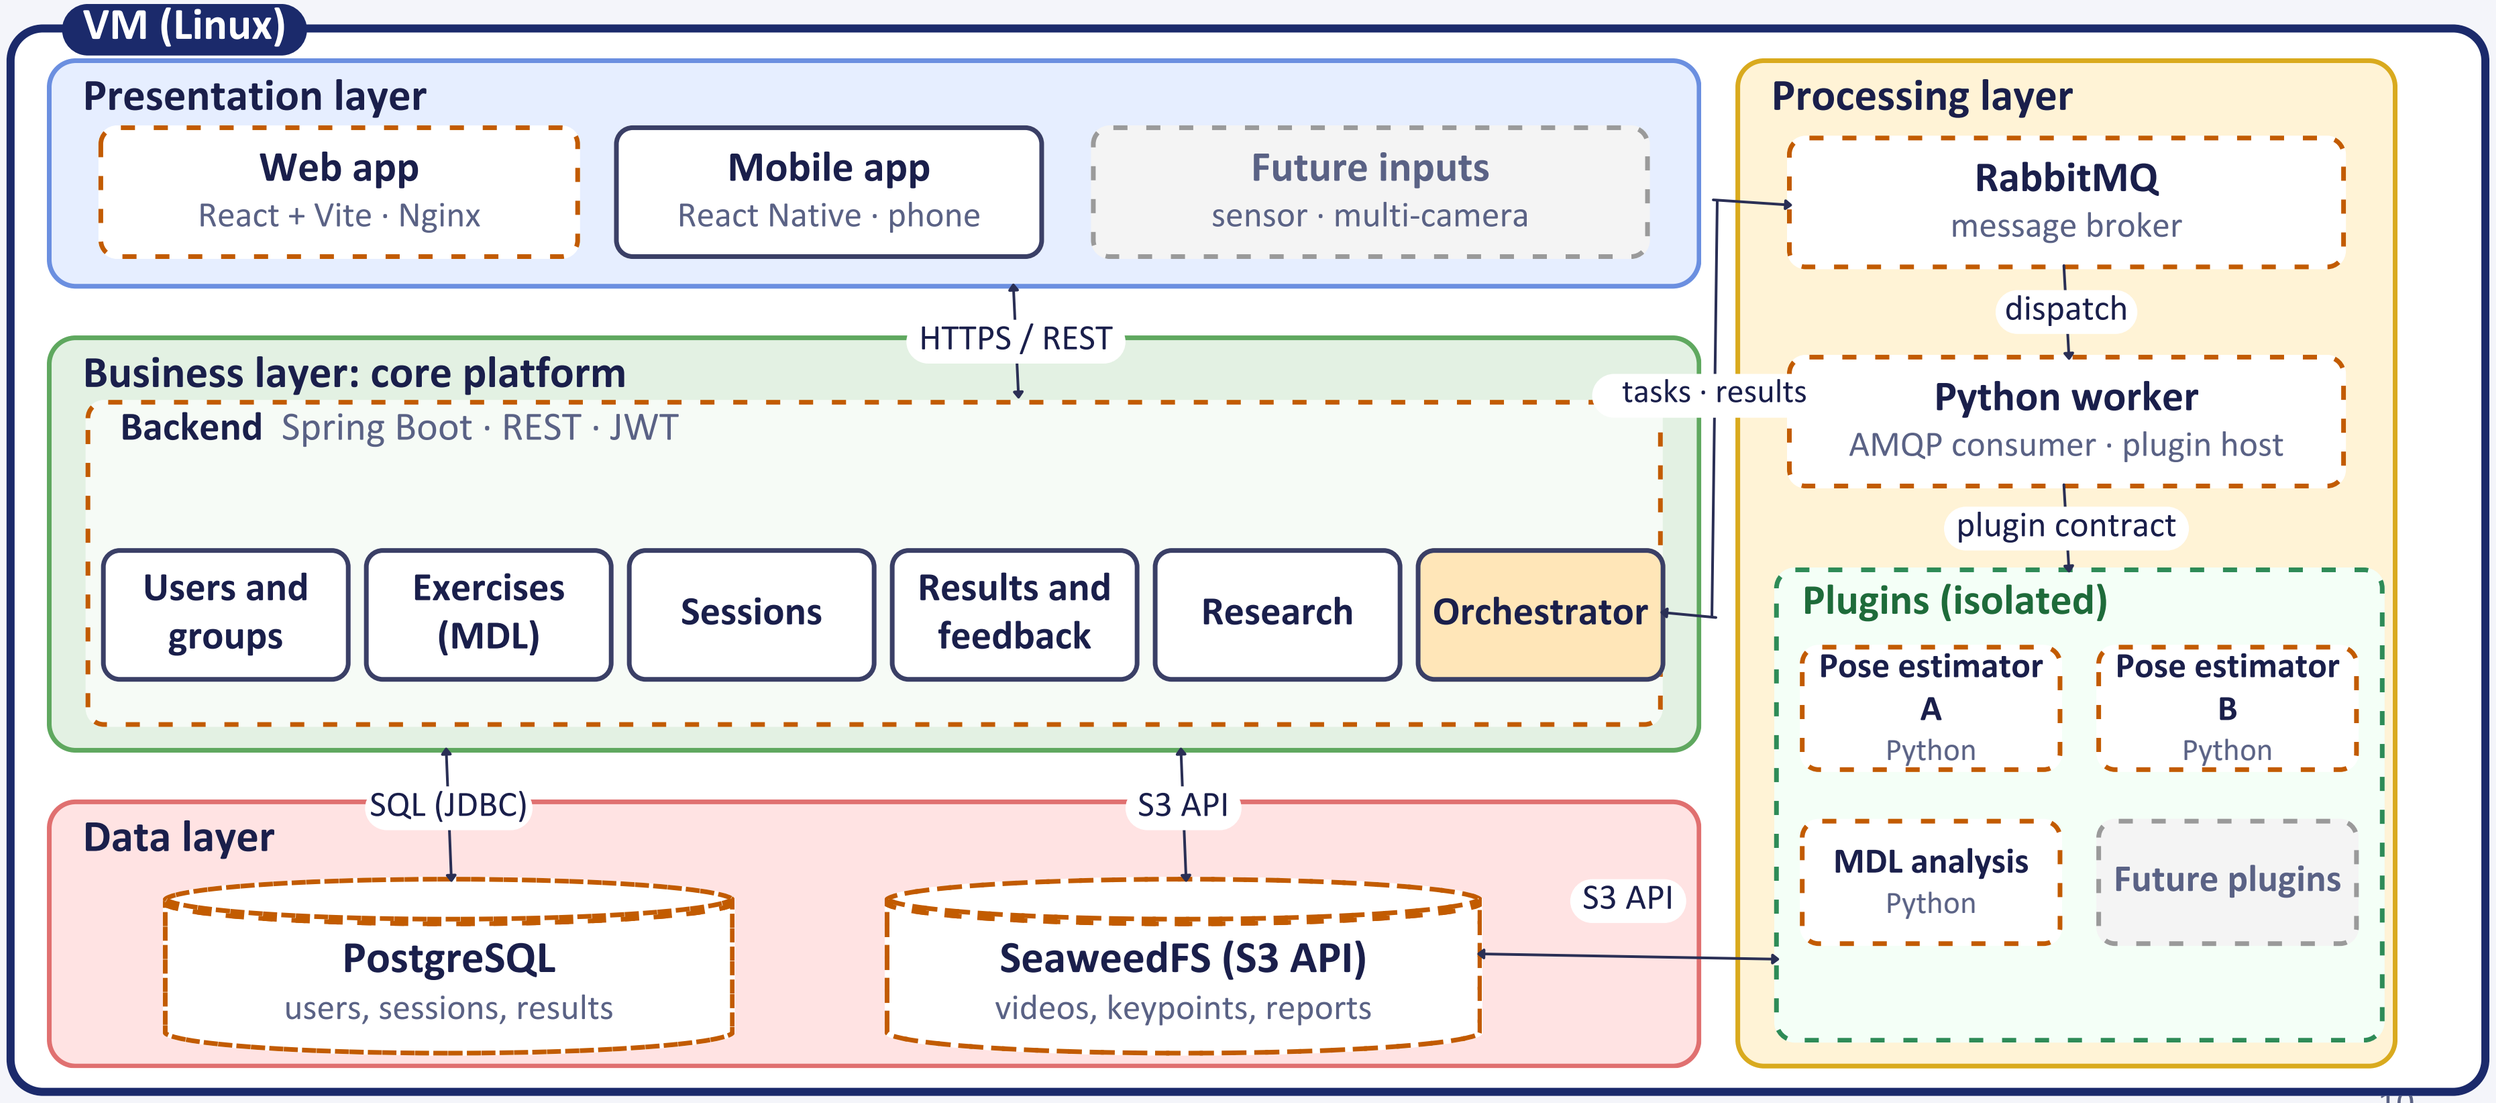

- MDL developed at IEETA
- Partner box: real videos and annotations
- Hardware to process and store video
- Decisions from the product owners: real time and heart-rate sensor

Architecture

Deployment and technologies

Docker container (Docker Compose)

Main flow: upload and analysis

1 Mobile app and API

The athlete uploads the video; the API checks the role.

POST /sessions/{id}/video

2 Object storage

The video is stored. Status: queued.

3 Orchestrator + queue

The orchestrator creates the task and puts it in the queue.

4 Worker

The worker picks up the task and fetches the video.

5 Plugins

Plugins run in order: pose estimation, then MDL analysis.

6 Database

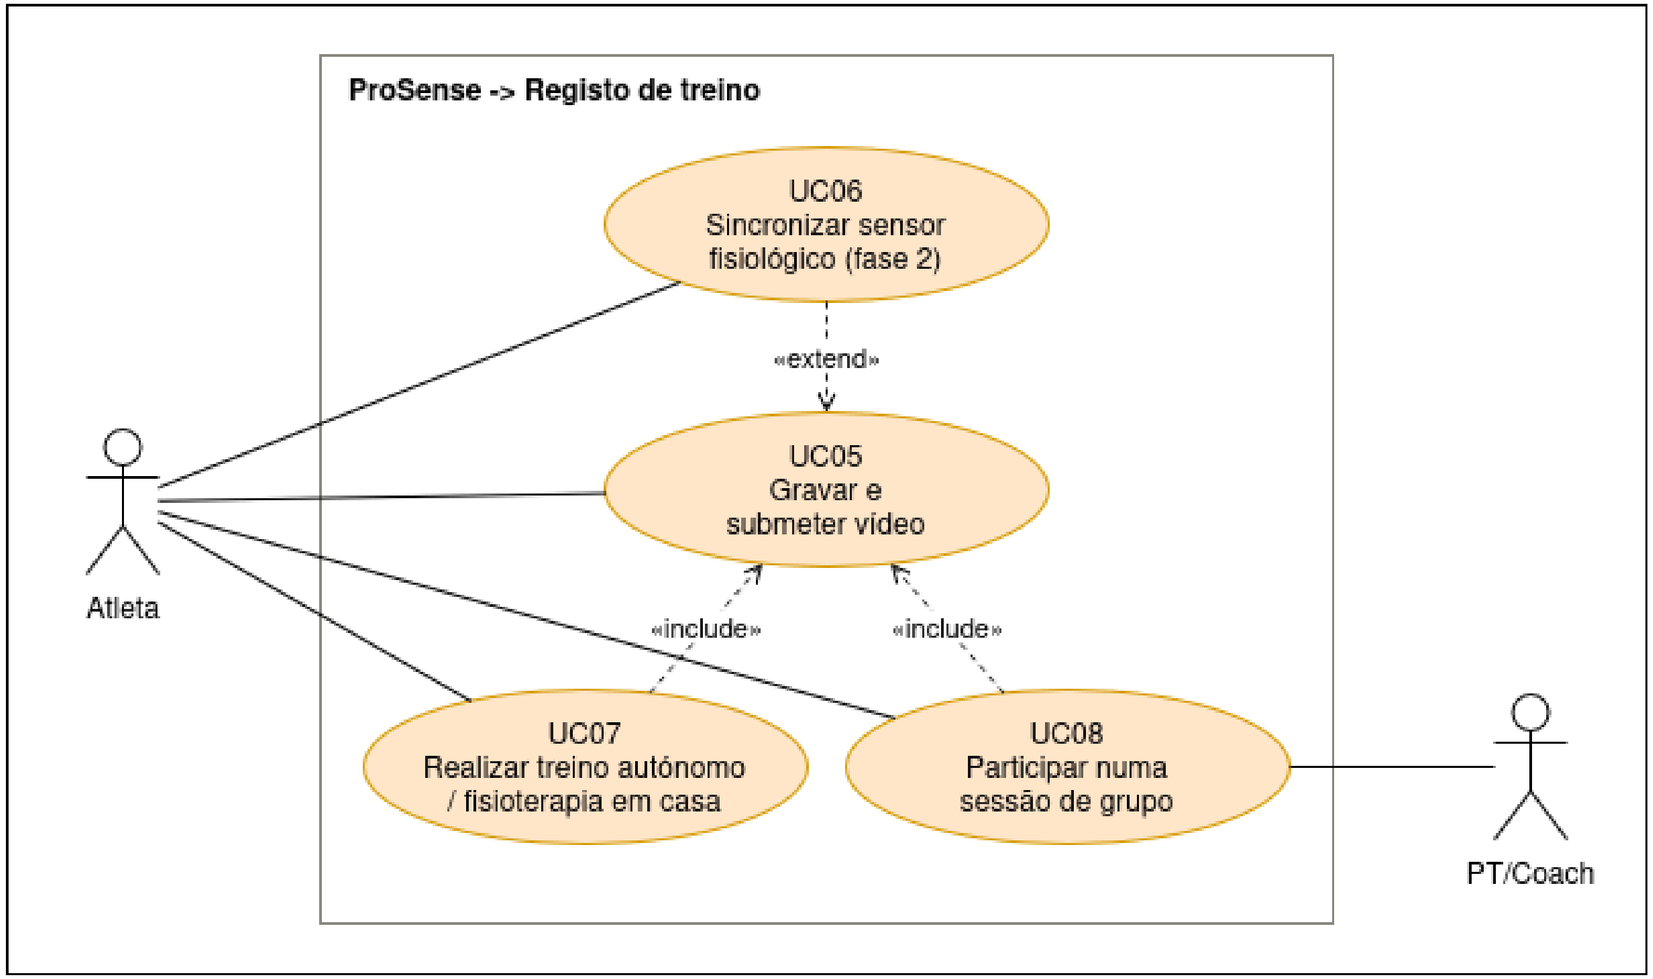

The result returns to the orchestrator, which saves the metrics. Status: done.

Architecture risks and mitigations

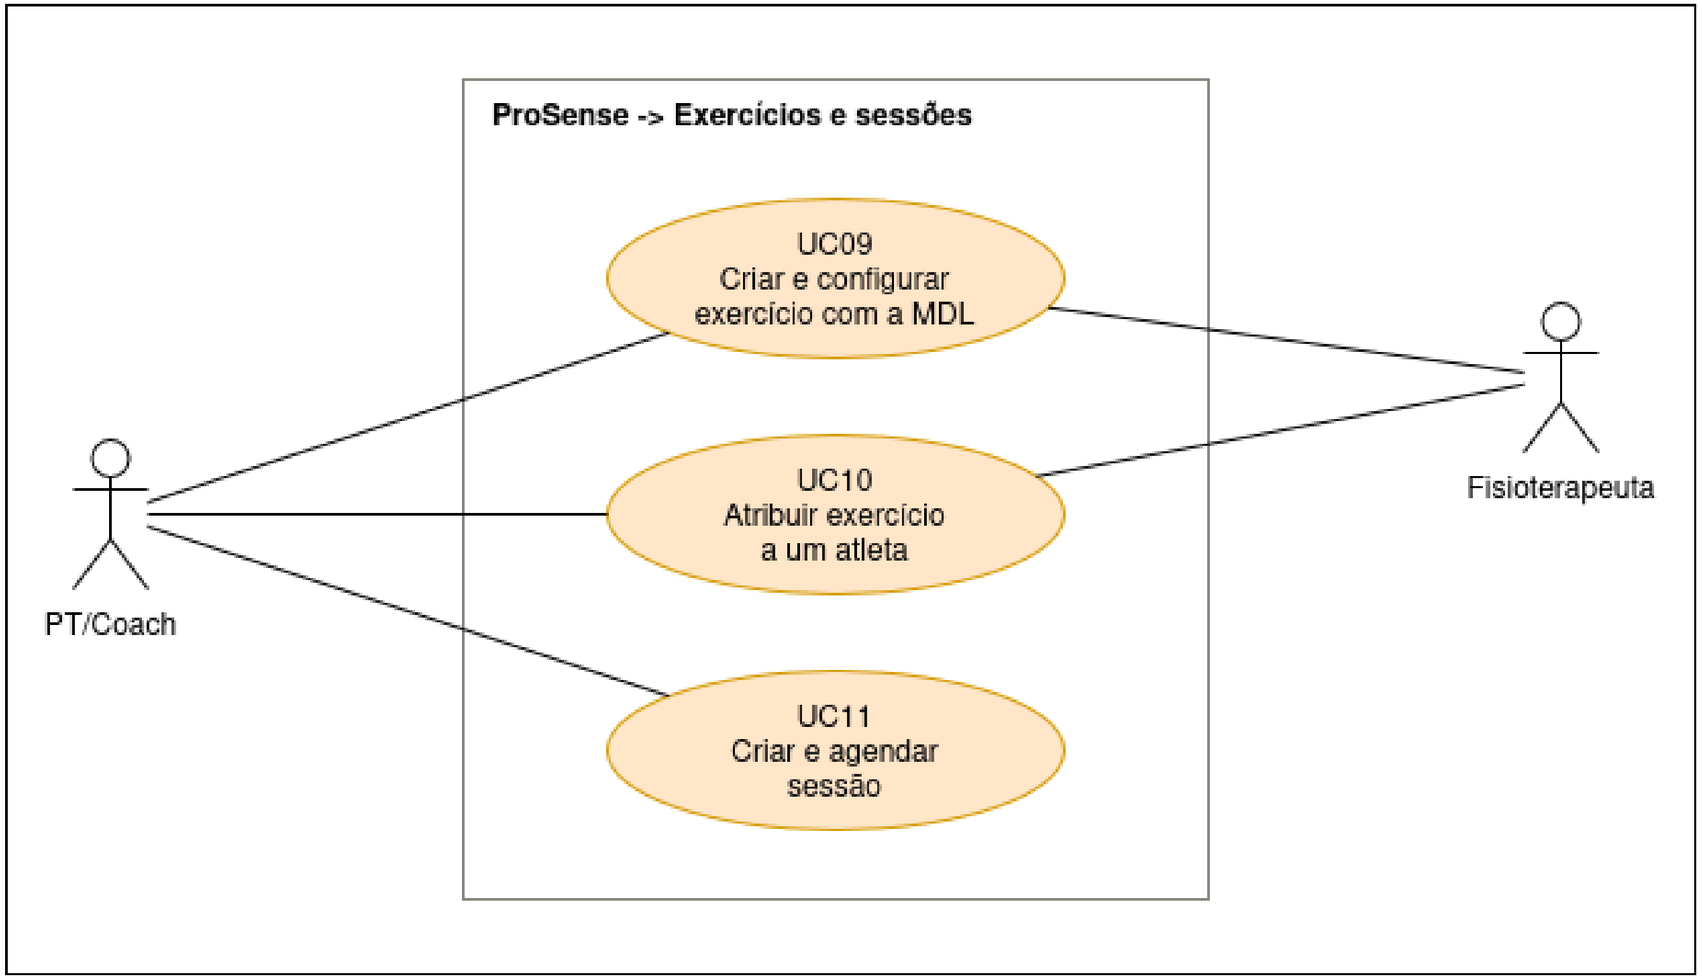

Risk	Impact	Mitigation	Effort
Pose quality in phone videos (poor light, angle, occlusion)	Less reliable results	Capture guide in the app; low-confidence warning; compare the two estimators	**High**
Slow analysis (CPU only)	Poor user experience	Asynchronous processing; status and notification; scale workers	**Low**
Large videos	Storage and upload problems	Direct upload to object storage; size limits; retention policy	**Medium**
Personal and health data (GDPR)	Legal risk	Consent, roles, encryption, retention policy	**Medium**
Real-time group classes (Should)	Needs a streaming architecture	Out of scope for now; decide with supervisors	**High**

Effort is a relative size, not hours.

Movement phases
Visual
MDL code
Each phase is a state. The movement moves to the next phase when the angles meet its condition. One full cycle counts as one rep.
1 Standing
knee > 160°
hip > 160°
2 Descent
knee between 100° and 160°
velocity < 0
3 Bottom
knee < 100°
4 Ascent
knee between 100° and 160°
velocity > 0
+ Add phase
After phase 4 the cycle returns to phase 1
Phase 2 · Descent
Selected
Joint
Knee
Minimum angle
100°
Maximum angle
160°
Tolerance
± 5°
Minimum time in phase
0.3 s
Velocity
< 0 (going down)
Validation
Phase 4: its angle range overlaps phase 2 without a distinct velocity condition.
